## FRONT MATTER

# About this report

---

This is a desk-research report. It was compiled in August 2026 entirely from publicly available sources, and it is built to be checked rather than believed.

Every quantitative claim in the pages that follow carries three things: a **data year**, a **source reference** keyed to the register in Annex A, and an **evidence grade**. Where sources disagree — and on Moroccan organic statistics they disagree a great deal — this report shows the disagreement instead of averaging it away. Where a number could not be established, it says so. The phrase *no data reported* appears often, particularly in the African country tables, and it is meant literally: it records the absence of a public figure, not an absence of activity.

The underlying datasets are published alongside this PDF as CSV files, together with the script that renders every figure and table here. Nothing in this document was typed by hand into a chart. If a number in the data is wrong, correcting the CSV and re-running the build corrects the report.

## § What this report is not

It is not a substitute for the primary statistical sources. The two datasets that would settle most of the open questions — the FiBL/IFOAM *World of Organic Agriculture* yearbook country tables and the full origin tables in the European Commission's annual organic-import brief — could not be opened directly during compilation; the network policy in the compilation environment refused every request to those hosts. Their content reached this report through search-index renderings, which is a real limitation and is graded accordingly throughout. Section 2 sets out exactly what that means and what it does not.

It is also not commissioned or endorsed by any of the organisations named in it. The producer and exporter directory in Section 5 is a research finding, not a recommendation, an accreditation, or a due-diligence report. Certification status changes; anyone contracting on the basis of this directory should verify current certificates directly with the certifying body before relying on them.

### READ THIS BEFORE QUOTING A NUMBER

Moroccan organic area statistics are not a single series. At least three incompatible figures circulate for wild-collection area, and the figure most widely reported in Moroccan media as the 2025 cultivated area is, on the evidence in Section 3.1, the FiBL 2023 data point re-published two years later. Quoting a Moroccan organic hectare figure without its data year and basis is very likely to be wrong.

SECTION 01

# Executive summary

Morocco is not an organic-area player. It is an organic-value player — and in 2024 it became a serious one, in a single product category, at the precise moment the rest of Africa’s organic sector was contracting under a European rule change Morocco was structurally well placed to absorb.

On certified hectares, Morocco is marginal. The most recent internationally comparable figure puts its certified organic cropland at **13 325 ha** for the 2023 data year — roughly **0.4 %** of Africa’s organic agricultural land, and about one thirty-eighth of Uganda’s. That figure is also **28 % below** Morocco’s own 2022 peak of 18 531 ha. Whatever the sector’s trajectory is, it is not a simple upward line.

On trade, the picture inverts. In 2024 Morocco shipped **7 307 tonnes** of organic *preparations of fruit, nuts and vegetables* into the European Union — the **fourth largest** third-country supplier of that category, ahead of Egypt, on a volume that had more than tripled in twelve months. Section 2.3 shows why this figure can be trusted: every published percentage in the source table reconciles arithmetically, and the implied 2023 base of 2 310 t matches the stated growth rate to the tonne.

|                                                                            |                                                                        |                                                                                    |                                                                      |

## 1.1 Ten findings

- 01 The decisive date for Moroccan organic exporters was 1 January 2025, not 31 December 2026.** Morocco was never on the EU’s list of recognised equivalent third countries. Its exporters reached the EU through recognised *control bodies* — a route that expired on 31 December 2024. Since 1 January 2025 Moroccan organic product must comply with EU production rules in full, certified by a body recognised under Article 46 of Regulation (EU) 2018/848. The widely reported 2026 deadline concerns the eleven equivalence countries, of which Tunisia is the only African one. It does not apply to Morocco.
- 02 That rule change is the best available explanation for Africa’s first organic contraction since 2011.** Certified organic farmland in Africa fell from about 3.4 million ha in 2023 to about **2.8 million ha in 2024**, a drop of roughly **17.6 %**, which FiBL attributes to the compliance requirement. African organic cocoa exports fell 22.7 % over the same period.
- 03 Morocco had less to lose from that shift than almost anyone.** Its exporters were already certified directly against EU rules by EU-recognised bodies — Ecocert above all — rather than against a national standard held out as equivalent. The regulatory shock that cost the continent hectares cost Morocco comparatively little.
- 04 Morocco’s export strength is in processed and prepared product, not raw tonnage.** It does not appear in the 2024 top ten for organic *fruit and nuts*, a category of roughly 1.02 million tonnes. It appears fourth in *preparations*. The value is in the transformation, not the harvest.

- 05 **The 2020 area target was missed by more than half, and the 2030 target is arithmetically far harder.** The 2011 contrat-programme sought 40 000 ha by 2020 and reached roughly 18 000 ha. The 2023–2030 contrat-programme seeks **100 000 ha** from a 2019 baseline of 14 000 ha. Section 8.2 sets out what that implies per year.
- 06 **The published Moroccan area series is not internally consistent, and part of it is recycled.** Cultivated area, wild-collection area and “total area concerned” are routinely conflated; wild-collection figures of 861 690, 273 000 and 201 728 ha all circulate. The figure reported in 2025 Moroccan media as the current cultivated area matches the FiBL 2023 data point.
- 07 **Certification economics, not agronomy, is the binding constraint on smallholder conversion.** Certification for EU or North American export is reported at up to **€1 000 per hectare per year**. Morocco subsidises it heavily — 90 % for units under 5 ha, capped at 10 000 MAD — but the cap binds long before the subsidy rate does.
- 08 **There is essentially no domestic organic market to fall back on.** The only market-size estimate this report could source is roughly **1 billion MAD** — and it dates from **2018**. Modern retail shelves carry mostly imported European organic product; Moroccan certified produce is largely absent from them.
- 09 **Water is the constraint that could make the rest academic.** Irrigation allocation from dams for the 2024–25 campaign was about **880 million m<sup>3</sup>**, roughly **17 %** of the volume national water planning documents foresee.
- 10 **Tunisia’s structural advantage over Morocco expires at the end of 2026 — unless it is extended to 2036.** Tunisia is the only African country with EU equivalence recognition. A December 2025 Commission proposal would extend that recognition by a decade. Whether it passes is the single most consequential open question for Morocco’s relative position in the Maghreb.

#### THE ONE-SENTENCE VERSION

Morocco should stop being benchmarked on hectares. On hectares it is a minor African producer and will remain one through 2030; on high-value processed organic exports into a European market whose own supply is growing at a third of the rate of its demand, it is already a top-five origin in the category where it competes.

## SECTION 02

# Method, evidence grading and known gaps

## 2.1 How the evidence was gathered

Research was conducted in August 2026 across five parallel workstreams: the Moroccan sector itself; Moroccan organic trade with the EU and its legal framework; verified Moroccan producers and exporters; comparative statistics for African countries; and the European demand side against which Morocco competes.

One constraint shaped the result and must be stated plainly. **Direct retrieval of source documents was blocked throughout.** The compilation environment's network policy refused connections to every statistical and regulatory host attempted — including [fibl.org](https://www.fibl.org), [statistics.fibl.org](https://statistics.fibl.org), [organic-world.net](https://www.organic-world.net), [orgprints.org](https://orgprints.org), [agriculture.ec.europa.eu](https://agriculture.ec.europa.eu) and [eur-lex.europa.eu](https://eur-lex.europa.eu). No primary PDF was opened. The content of those documents reached this report through a search index's rendering of them.

The practical consequences are specific rather than general. Figures that appear in the summary text of a primary document — headline totals, top-five rankings, regulation numbers and dates — came through reliably and are frequently corroborated across independent secondary renderings. Figures that live only inside annex tables of a PDF — the full FiBL country tables for Africa, the complete origin list in the Commission's import brief, the Morocco entries in Annex II of Regulation (EU) 2021/1378 — did not come through at all. That is why this report can tell you Morocco was fourth in one EU import category but cannot tell you its overall rank, and why 9 African countries carry a land figure rather than 54.

## 2.2 The grading scale

Every tabulated figure carries one of four grades. The grades describe *how well attributed* a figure is, not how much this report likes it.

**A Primary, directly retrieved.** The source document was opened and the figure read from it. *No figure in this edition carries grade A*, for the reason given in 2.1 — the grade is defined so that a future edition with working document access can use it.

**B Primary, indirectly retrieved.** Attributable to a named primary document (a FiBL yearbook, a Commission analytical brief, a regulation, a judgment) with a stated data year, reached through a search index and, where checkable, arithmetically self-consistent or corroborated by an independent rendering.

**C Secondary or undated.** A single trade-press, ministerial-page or academic rendering; or a figure whose data year could not be established. Usable directionally; not for contracting.

**D Contested or failed verification.** Reported for transparency and explicitly not relied on. These appear in the text, flagged, rather than in the tables.

Two classes of claim in this report carry grade D and are worth naming here. The first is the assertion, repeated in Moroccan trade commentary, that Morocco holds EU equivalence recognition under a “Decision 2016/132” — Section 4.2 explains why this report treats that as wrong. The second is a widely circulated table of Moroccan control-body codes (MA-BIO-102 and similar); it is internally inconsistent, it attributes the same code to two different bodies, and it appears to derive from a version of an annex that was repealed. **This report publishes no control-body code list.**

## 2.3 Two figures reconciled by arithmetic

Where a primary table could not be opened, internal arithmetic was used to test whether the extracted numbers hold together. Two cases mattered enough to record.

### The Morocco import figure: confirmed

Morocco's 2024 entry in the EU organic import brief was extracted as "7 307 t, +216.3 %, 5.6 % share". A 5.6 % share of total EU organic imports would be impossible — 7 307 t against a 2.64 million tonne total is 0.28 %. But the figure is not a share of the total. It is a share of the *preparations of fruit, nuts and vegetables* category, whose total is 130 708 t. Testing every row of that category against that denominator:

TABLE 2.1 · ARITHMETIC RECONCILIATION OF THE 2024 CATEGORY TABLE

| Supplier       | Tonnes       | Published share | Recomputed share | Agrees     |
|----------------|--------------|-----------------|------------------|------------|
| India          | 11 398       | 8.7 %           | 8.72 %           | yes        |
| Mexico         | 7 919        | 6.1 %           | 6.06 %           | yes        |
| Brazil         | 7 357        | 5.6 %           | 5.63 %           | yes        |
| <b>Morocco</b> | <b>7 307</b> | <b>5.6 %</b>    | <b>5.59 %</b>    | <b>yes</b> |
| Egypt          | 4 404        | 3.4 %           | 3.37 %           | yes        |

**Reading:** all five rows reconcile to the 130 708 t category total within rounding. Independently, dividing Morocco's 7 307 t by the stated growth factor of 3.163 yields a 2023 base of 2 310 t — a clean integer, consistent with a genuine prior-year figure rather than a transcription artefact. The row is treated as grade B. Source E26.

### The top-five supplier shares: not reconciled

The same exercise fails for the headline supplier ranking. The tonnages (Ecuador 434 970 t, China 314 404 t, Peru 220 333 t, Dominican Republic 177 642 t, Ukraine 174 701 t) pair with 2023 comparators that match the previous year's brief, which places them in 2024. But the shares published alongside them (14.6 %, 10.6 %, 7.4 %, 6.0 %, 5.9 %) reconcile only against a total of about 2.98 million tonnes — the 2025 total, not the 2.64 million tonne 2024 total. One of the two pairings is wrong. This report therefore publishes the tonnages as 2024, recomputes the shares itself against the 2024 total, labels them as author calculations, and grades the 2025 total figure C.

## 2.4 The open-question register

These are the questions a subsequent edition with primary document access should close, in order of how much they would change the analysis.

TABLE 2.2 · WHAT THIS EDITION COULD NOT ESTABLISH

| #  | Open question                                                                                    | Where the answer is                                                            |

## SECTION 03

# Morocco: the organic sector

## 3.1 Certified area — and why the series contradicts itself

There is no single Moroccan organic area series. There are at least three, measuring different things, and they are quoted interchangeably.

The first measures **cultivated organic land** — certified cropland under management. This is the figure comparable to international statistics, and it is the one used throughout this report. The second measures **wild-collection area**: the argan forest and the rangeland from which wild aromatic and medicinal plants are gathered under organic certification. The third is a “**total area concerned**” that sums the two. Because the wild-collection component is one to two orders of magnitude larger than the cultivated component, the choice of basis changes the headline by a factor of twenty.

**FIGURE 3.1 · CERTIFIED ORGANIC CULTIVATED LAND, MOROCCO**

Hectares. Only points with an attributable source are plotted; the series is not continuous and mixes national and FiBL bases — see Table 3.1.

Sources: M1, M7, M8, M9, M12, M14, M17. Grades B–C throughout.

**TABLE 3.1 · THE MOROCCAN AREA SERIES, WITH ITS BASES**

| Reference year | Cultivated (ha) | In conversion | Wild collection | Basis                               | Ev. |
|----------------|-----------------|---------------|-----------------|-------------------------------------|-----|
| 2011           | 4000            | –             | –               | national contrat-programme baseline | C   |
| 2015           | 8046            | 1840          | 861 690         | ISO FAR country report              | C   |
| 2017/18        | 9500            | 1 000         | 273 000         | ONCA / ministry campaign data       | B   |
| 2019           | 11 000          | –             | –               | national press                      | C   |
| 2021           | 18 000          | –             | –               | national press                      | C   |
| 2022           | 18 531          | –             | 201 728         | FiBL series / ministry indicators   | B   |
| 2023           | 13 325          | –             | –               | FiBL series                         | B   |

**Note on the wild-collection column:** the three figures shown — 861 690 ha (2015), 273 000 ha (2017/18) and 201 728 ha (2022) — differ by more than a factor of four. The 2015 figure appears to count the certified argan forest in its entirety; the later two appear to count a narrower certified base. They should not be read as a trend.

**Note on 2023:** the 13 325 ha FiBL point is 28.1 % below the 2022 peak. Moroccan sector commentary published in 2025 reports “13 300 ha” as a current figure; on the evidence available that is the same 2023 data point, re-dated.

**WHAT THE 2022 → 2023 FALL PROBABLY IS NOT**

A 28 % single-year loss of certified cropland is large enough to invite explanation, and the temptation is to attribute it to drought or to the EU compliance transition. The honest position is that this report cannot attribute it. The transition's operative date was 1 January 2025, two years later. Neither ONSSA nor the ministry published a reconciliation. A methodological change in what FiBL counted for Morocco is at least as plausible as a real loss of certified hectares, and cannot be ruled out without the yearbook's country notes.

### 3.2 Operators, output and the structure of production

The most recent operator count this report could attribute is **more than 650 certified operators** at the end of 2021 — farms, companies and cooperatives combined. Earlier country reporting put the figure at 260 entities in 2015. No 2023, 2024 or 2025 count from ONSSA or the ministry could be verified; a figure of roughly 4 200 operators inspected annually that circulates in commercial guides almost certainly refers to all operators under food-safety supervision rather than organic ones, and is not used here.

On output, the defensible figures are 2022: **94 795 tonnes** from cultivated crops, of which **20 230 tonnes** were exported — split roughly 9 000 t fresh and 11 230 t processed. That split matters. It is the earliest clear signal of the pattern Section 4.3 finds in the European import data: Morocco's organic trade is disproportionately *prepared* product, and has been for some years.

By share of cultivated organic area, the sector is led by **aromatic and medicinal plants at about 21 %**, carob at 16 %, olive at 13 % and vegetable crops at 12 %; the data year for that breakdown is not stated in the source and it is graded C. Organic fruit species covered 3 568 ha in the 2017/18 campaign, of which almond 870 ha, caper 550 ha, avocado 500 ha, strawberry 210 ha, apricot 80 ha, pomegranate 72 ha and vine 40 ha.

**A GAP THAT MATTERS COMMERCIALY**

No certified-organic tonnage could be established for any individual Moroccan crop — not argan oil, olive oil, citrus, tomato, berries, dates, saffron or prickly pear. The large and frequently quoted numbers for these products (187 000 t of olive oil exported in 2023; 64 400 t of raspberries in 2024/25; roughly 4 000 t of argan oil a year) are **whole-sector figures covering conventional and organic together**. This report does not convert them into organic estimates, and neither should anyone else without a certified share.

### 3.3 Where the sector sits on the map

Cultivated organic production is concentrated in five regions, which together account for roughly four fifths of the area: **Fès-Meknès (19 %)**, **Marrakech-Safi (18 %)**, **Souss-Massa (16 %)**, **Casablanca-Settat (16 %)** and **Rabat-Salé-Kénitra (14 %)**. The components as published sum to 83 %; the data year is not stated and is consistent with the 2017/18 dataset.

The functional geography is sharper than those shares suggest. **Souss-Massa** is the organic market-garden basin — off-season vegetables under a subtropical climate — and simultaneously the entire argan zone, which is what gives the region its double weight in any value-based reading. **Marrakech-Safi and Fès-Meknès** carry the tree crops and the aromatic and medicinal plants, with verbena around Marrakech, saffron at Taliouine in Taroudant, and capers around Fès. **Drâa-Tafilalet** holds roughly 90 % of national date production and 43 % of its own regional agricultural value added, but no organic-certified area or

tonnage for the region could be established. For the **Oriental** region this report found no organic-specific data at all.

### 3.4 Law 39-12 and the national control system

Morocco's organic framework is **Law 39-12** on the organic production of agricultural and aquatic products, published in the *Bulletin Officiel* on **21 February 2013** and making Morocco the second African country with dedicated organic legislation. Its implementing decrees cover conditions of application, labelling, control and certification, and the national organic logo — marketed as **BIO MAROC** — with sectoral decrees for crops, livestock, aquaculture, processing and distribution. The law was drafted to harmonise with the EU framework then in force, Regulation (EC) 834/2007, and subsequently with Regulation (EU) 2018/848.

It did not take effect on publication. **Effective application began only in September 2018**, five and a half years later — a gap that explains why so much Moroccan organic commentary dated 2013–2018 describes a framework that was not yet operating.

Institutionally, **ONSSA** is the competent authority: it approves control and certification bodies, publishes the technical regulation and handles sanctions. It does not itself certify producers. The ministry approves the *cahiers des charges* and manages accreditation, advised by a national commission for organic production whose remit includes recognising equivalence for exporting countries. **Ecocert Maroc** was the first body accredited to certify against the Moroccan national standard, in 2018; **Bureau Veritas** and **CCPB** are also present, the latter reinforcing its Agadir operation. A count of nine approved bodies circulates but rests on a single low-quality source and is not adopted here.

On the interprofessional side there has been churn. **AMABIO**, created in 2010, signed the 2011 contrat-programme. **FIMABIO**, founded 2016 and recognised by the state in 2017, lost its status as the state's interlocutor in 2020 after internal disputes. **Maroc Bio**, constituted on 16 June 2022, is the current recognised interprofession and signed the 2023–2030 contrat-programme. Three interlocutors in a dozen years is itself a finding about the sector's organisational depth.

### 3.5 Two contrats-programmes, one missed target

| Programme                             | Period    | Budget (bn MAD) | Area target (ha) | Output (t) | Exports (t) | Outcome                                                           |
|---------------------------------------|-----------|-----------------|------------------|------------|-------------|-------------------------------------------------------------------|
| Contrat-programme (State - AMABIO)    | 2011-2020 | 1.12            | 40 000           | 400 000    | 60 000      | Missed. ~18000 ha reached by end-2021, under half the area target |
| Contrat-programme (State - Maroc Bio) | 2023-2030 | 1.50            | 100 000          | 600 000    | 114 000     | In progress; baseline 14000 ha (2019)                             |
| Generation Green                      | 2020-2030 | –               | 100 000          | –          | –           | Organic component of the national agricultural strategy           |

**Reading:** the 2011 programme's area target was missed by more than half. The 2023–2030 programme sets a target 2.5 times larger from a baseline of the same order. Section 8.2 works through what that implies. Sources M11, M12, M15, M17, M32, M36, M37.

Alongside the programmes sits a real and reasonably generous subsidy instrument. The **Fonds de Développement Agricole** covers **90 %** of certification cost for production units between 0.5 and 5 ha, capped at 10 000 MAD per unit per year; **70 %** for units above 20 ha, capped at 40 000 MAD; and **80 %** for livestock and beekeeping products, capped at 25 000 MAD. Support runs for three years per unit. The bands between 5 and 20 ha could not be established.

The caps, not the rates, are what bind. Certification for EU or North American export is reported at up to **€1 000 per hectare per year**. At that rate a 4-hectare unit faces roughly €4 000 — about 43 000 MAD — against a subsidy ceiling of 10 000 MAD. The 90 % headline rate delivers something closer to 23 % of

actual cost at the top of its own band. For a smallholder, the arithmetic of conversion is decided by the cap.

### 3.6 The domestic market that barely exists

The only domestic market estimate this report could source values Moroccan organic retail at roughly **1 billion MAD a year** — and it dates from **2018**. Eight years is a long time to run on a single number, and its continued circulation is itself evidence of how little the domestic segment is measured.

What is better attested is the shape of the channel. Modern food retail in Morocco is consolidated around six players; their organic sections carry mostly **imported processed product from France, Spain and Germany**, in small and poorly promoted fixtures, with Moroccan certified produce largely absent from the shelves. Consumers continue to buy fresh produce through traditional trade. Specialist shops, box schemes and organic markets exist but are unmeasured. The reported constraints are price, availability, information, and confusion between the national label and the various private and foreign marks.

The consequence for exporters is structural: **there is no domestic buffer**. A Moroccan organic operator who loses an EU customer has nowhere else to place certified product at a premium, and will sell it as conventional. That asymmetry — full certification cost, conventional fallback price — is the sector's central commercial risk, and it is why the EU regulatory questions in Section 4 are existential rather than administrative.

### 3.7 Water: the binding constraint

Morocco has been in an extended drought since 2022. Dam fill rates stood at **28.47 %** in 2024 and **39.23 %** at 11 June 2025, both improvements on their prior-year comparators but far below planning assumptions; a later 2025/26 figure of roughly 75.9 % after heavy rains appears in reporting but could not be individually attributed and is graded C.

The number that matters for irrigated horticulture is the allocation. Dam releases for irrigation in the **2024–25 campaign were about 880 million m<sup>3</sup>** — roughly 17 % of the 5.3 billion m<sup>3</sup> a year foreseen in national water planning. Per-capita availability is trending toward 300 m<sup>3</sup> a year, the conventional threshold for absolute scarcity.

This bears on organic conversion in a way that is easy to miss. Morocco's organic export crops are concentrated in exactly the irrigated, high-value, water-intensive systems — Souss-Massa greenhouse vegetables, berries around Larache, citrus — that are most exposed to allocation cuts. The wild-collection base (argan, rangeland aromatics) is rain-fed and far more robust. A water-constrained decade therefore does not simply slow the sector; it biases it toward the wild-collected, low-intensity end of the portfolio, which is the end with the least room to grow area.

## SECTION 04

# Morocco and the European Union

## 4.1 The regime change of 1 January 2025

Until the end of 2024, organic product could enter the EU from a third country by one of two routes: the country itself was recognised as having an *equivalent* organic system, or the individual *control body* certifying the operator was recognised as applying equivalent standards. Both were equivalence routes. Neither required the product to meet EU production rules exactly.

Regulation (EU) 2018/848 replaced that architecture with **compliance**. From 1 January 2025 organic product imported from a third country must satisfy EU production rules in full, certified by a control body recognised under **Article 46** and listed in Annex II of Regulation (EU) 2021/1378. The control-body equivalence route closed on 31 December 2024, and the annex that carried it was formally deleted in May 2025.

| Date              | Event                                                                                                                                           | Instrument                                             | Consequence for Morocco                                                                              |

| 2026-05-11        | Council agrees its negotiating position on the organic simplification package                                                                   | Council of the EU                                      | Shapes the post-2026 framework both Maghreb origins will operate under                               |
| 2026-12-31        | Recognition of the 11 Annex I equivalent third countries expires (absent the proposed extension)                                                | Reg. (EU) 2021/2325 art. 1                             | Tunisia's grandfathered advantage lapses; Morocco and Tunisia converge on the same compliance regime |

Rows highlighted are the two dates that actually bind Moroccan exporters. Sources E8–E22. All grade B.

## 4.2 Morocco was never on the equivalence list

This is the point on which Moroccan commentary most often goes wrong, and it inverts the usual reading of Morocco's position.

The EU's list of recognised equivalent third countries — Annex I of Implementing Regulation (EU) 2021/2325, carried over from Annex III of Regulation (EC) 1235/2008 — contains **eleven countries**: Argentina, Australia, Canada, Costa Rica, India, Israel, Japan, New Zealand, South Korea, Tunisia and the United States. **Morocco is not among them and never has been.** Assertions that Morocco holds country-level equivalence, and the associated reference to a "Decision 2016/132", could not be verified against any regulatory text and are graded D.

Morocco's exporters instead used the control-body route: certification by bodies recognised for equivalence, listed in Annex II of the same regulation. That is the route that closed on 31 December 2024.

### WHY THIS IS BETTER NEWS FOR MOROCCO THAN IT SOUNDS

Because Morocco had no country-level equivalence to lose, its exporters were already dealing directly with EU-recognised certifiers — predominantly Ecocert, whose parent entity appears on the first Article 46 compliance list adopted in June 2024. An operator certified by such a body experienced the 2025 transition as a change in the standard applied, not as a loss of market access. Origins that had leaned on a national standard held out as equivalent faced a far harder adjustment, and Section 6.1 shows what that cost the continent.

Meanwhile the deadline that dominates the trade press — **31 December 2026**, when the Annex I recognitions expire — does not concern Morocco at all. It concerns the eleven equivalence countries, of which **Tunisia is the only African one**. In December 2025 the Commission proposed extending those recognitions to **31 December 2036**; the Council agreed its negotiating position on the wider organic simplification package in May 2026. Whether that extension passes determines whether Tunisia keeps a decade more of grandfathered advantage or converges on Morocco's compliance footing at the end of this year. It is the most consequential unresolved question in Maghreb organic trade.

## 4.3 What Morocco actually ships

EU organic imports totalled about **2.64 million tonnes in 2024**, up 6.4 % on a 2023 that had itself fallen sharply. The Netherlands is the largest destination member state by volume, which reflects Rotterdam and Antwerp as entry points rather than final consumption.

**FIGURE 4.1 · EU IMPORTS OF ORGANIC AGRI-FOOD PRODUCTS**

Million tonnes, all third countries. 2025 is graded C — see Section 2.3.

Sources: E8b, E9b, E10, E26, E27.

| Year | Total organic imports (t) | Change  | Ev.      | Note                                                                    |
|------|---------------------------|---------|----------|-------------------------------------------------------------------------|
| 2021 | 2 870 000                 | –       | <b>B</b> |                                                                         |
| 2022 | 2 730 000                 | –5.1 %  | <b>B</b> | Analytical Brief No 2                                                   |
| 2023 | 2 480 000                 | –9.2 %  | <b>B</b> | Analytical Brief No 4                                                   |
| 2024 | 2 640 000                 | +6.4 %  | <b>B</b> | Analytical Brief No 7                                                   |
| 2025 | 2 976 000                 | +12.8 % | <b>C</b> | Secondary rendering only; see methodology note on the share discrepancy |

Within that total, Morocco's position is category-specific and striking.

| 4                           | Morocco  | 7 307    | 5.6 %             | +216.3 %       | <b>B</b> |
| 5                           | Egypt    | 4 404    | 3.4 %             | +56.3 %        | <b>B</b> |
| Category total, all origins |          | 130 708  | 100.0 %           | +7.6 %         |          |

Morocco's +216.3 % is the largest movement in the category and implies a 2023 base of 2 310 t. On volume it sits 50 t behind Brazil.

Set against the headline supplier ranking, the contrast is the finding.

| – Morocco (all organic categories) |                    | not published in any retrievable table |          |         |                   |          |

Shares are author calculations against the 2.64 Mt 2024 total; the shares published alongside these tonnages reconcile to a different total, as Section 2.3 sets out. Morocco does not appear in the 2024 top ten for organic fruit and nuts — a category of roughly 1.02 million tonnes led by Ecuador at 36.5 %. Its strength is not in raw fruit volume.

The conclusion is that Morocco competes in the EU organic market on transformation rather than tonnage. A country that is invisible in a one-million-tonne raw fruit category and fourth in a 131 000-tonne preparations category is telling you where its margin is. That is consistent with the 2022 national export split — 11 230 t processed against 9 000 t fresh — and it is consistent with the composition of the operator directory in Section 5, which is dominated by oils, preserved products, couscous, essential oils and saffron rather than by fresh produce shippers.

## 4.4 Tariffs, quotas and the Western Sahara judgments

Organic trade rides on the general EU–Morocco agricultural framework, and two features of it bear on organic exporters.

The first is the **tariff-rate quota system** under the 2012 liberalisation exchange of letters. Tomatoes carry a zero-duty quota of **285 000 t a year**, allocated monthly from 1 October to 31 May, with a conventional entry price of **€0.461/kg** over the same window and a 60 % ad valorem reduction, unlimited, from June to September. Ad valorem duties were abolished for fruit and vegetables generally, except tomatoes, garlic, cucumbers, courgettes, tangerines and pears. Morocco has exceeded the tomato quota every year since 2019 — over-quota volumes remain lawful on payment of duty, and roughly €81 million in duties were collected between 2019 and 2024. These figures are graded C and cover the whole sector, not organic specifically.

The second is the **4 October 2024 judgments of the Court of Justice**.

| Case                                                                                | Date       | Subject                                            | Holding                                                                                                                                                                                                    |

Sources E29–E33. The duration for which the Court maintained the effects of the annulled decisions could not be established and is listed as open question 6 in Table 2.2.

For organic operators the practical consequence is not tariff but **traceability**. Produce grown in the Western Sahara — Dakhla-region tomatoes and melons above all — must be declared as originating there, and Western Sahara is a distinct customs territory in EU law. An organic certification chain already has to carry parcel-level origin data to satisfy Regulation (EU) 2018/848; the judgments make that data legally consequential at the border as well. Operators whose certified units span both territories should expect origin declaration, not organic status, to be the audit point.

## 4.5 Export control and logistics

An organic consignment leaving Morocco needs **two** documents, not one: the organic certificate and certificate of inspection issued through its control body and lodged in TRACES, and a conformity certificate from **Morocco Foodex**.

Morocco Foodex — the former EACCE, created in 1986 — is the statutory technical control authority for exports of fruit and vegetables, processed agri-food and seafood, and it issues a per-lot inspection certificate for every export shipment. It is certified to ISO 9001:2015, its six regional laboratories are COFRAC-accredited to ISO 17025, and it holds EU recognition for conformity checks against marketing standards for fresh fruit and vegetables. Several of the operators in Section 5 describe lot-by-lot Foodex analysis as a routine part of their quality control.

On routing, the single most consequential choice is port. **Agadir** offers direct reefer container services to Rotterdam, Antwerp and Nantes and is the correct gateway for Souss-Massa organic vegetables, citrus and argan; sending the same cargo through **Tanger Med** adds more than 700 km of reefer trucking and a corresponding cold-chain risk. Tanger Med — 10.24 million TEU and 516 000 trucks in 2024 — is the right choice for road and roll-on/roll-off traffic to Algeciras and onward through Spain and France. Air freight out of Agadir and Casablanca is a small share by weight and is reserved for berries, fresh herbs and high-value aromatics.

## SECTION 05

# Producers and exporters

## 5.1 How operators were verified

This directory contains 30 Moroccan operators, in three tiers of evidence. An operator was admitted only where a current, locatable public source confirms that the entity exists and is organic-certified or organic-trading. Reputation, frequency of mention and marketing language were not accepted as evidence.

The strongest evidence used is an entry in a certifier's **public certificate register** — principally Ecocert's — which confirms live certification and its scope (EU organic, USDA NOP) at the time of consultation. The next strongest is an operator's own site stating a named certification, corroborated by an independent source such as a trade directory, a development-agency case study or an exhibitor catalogue.

Three limits should be read with the table. First, certification is a moving state and these entries are a snapshot. Second, the absence of an operator from this directory means only that the research did not verify it; several of Morocco's largest agricultural exporters are absent for exactly that reason, as Section 5.4 explains. Third, the distribution of the directory is a finding in itself: it is dominated by argan cooperatives and processed-product companies, which is what one would expect from the trade data in Section 4.3, and it contains very few fresh-produce shippers.

## 5.2 Directory — verified operators

16 operators for which a live source confirms both existence and organic certification or organic trading.

| Operator                                                               | Location                                                   | Legal form                                                          | Organic range                                                                         | Certification evidence                                                           | EU                                                                 |

**Certification abbreviations:** EU organic = Regulation (EU) 2018/848; NOP = USDA National Organic Program; FFL = Fair for Life; PGI = protected geographical indication (Argane); PDO = protected designation of origin. Two entries are marked in the certification column where the organic claim is confirmed but the certifying body could not be identified. Sources X1–X37, X49.

### 5.3 Partially verified and register-only entries

6 operators whose existence and export activity are confirmed but whose organic certification could not be established. They are listed because they are substantive players in categories where organic supply is being sought, and because recording the uncertainty is more useful than omitting them silently.

| Operator                       | Location                | Legal form                                | Organic range                                                                            | Certification evidence                                              | EU                 |
|--------------------------------|-------------------------|-------------------------------------------|------------------------------------------------------------------------------------------|---------------------------------------------------------------------|--------------------|
| Abelta SARL (Bio Herbs Export) | Morocco                 | Private company                           | Medicinal and aromatic plants, herbs, spices, seeds - >30 species                        | Organic marketing; certifying body not confirmed                    | Export-oriented    |
| Assil Nature                   | Morocco                 | Private company                           | Medicinal and aromatic herbs, natural oils (artemisia, blue tansy, eucalyptus, lavender) | Organic marketing; certifying body not confirmed                    | Export             |
| CapersMed                      | Fès (Fès-Meknès)        | Private company                           | Capers, caperberries, piparras                                                           | BRCGS Food Safety Grade A; organic status not confirmed             | Yes - EU wholesale |
| Difat Ziz                      | Erfoud (Drâa-Tafilalet) | Union of 30+ date cooperatives            | Majhoul (Medjool) dates                                                                  | Sustainability positioning; organic status not confirmed            | Export             |
| Coopérative Jnan Erfoud        | Erfoud (Drâa-Tafilalet) | Coopérative of small and medium producers | Majhoul dates                                                                            | Local and international quality standards; organic not confirmed    | Export             |
| Coopérative Tamaynoute         | Souss-Massa             | Women's argan cooperative                 | Argan oil                                                                                | Publishes a certification page; specific certificates not retrieved | not confirmed      |

A further 8 entries appear in a certifier's public register with confirmed live organic certification, but with too little independent presence to establish products, scale or export markets. Certification is the strongest single form of evidence in this directory, so these are recorded despite the thin company detail.

| Operator                 | Location    | Legal form        | Organic range | Certification evidence                             | EU  |

Source X49, Ecocert directory of certified customers. One further register entry, *Les Agrumes de Méditerranée*, was excluded because its Moroccan nationality could not be confirmed.

## 5.4 Names deliberately excluded

Some absences would otherwise look like oversights.

### Azura Group / Maraissa

Among Morocco's largest tomato exporters to the EU, with more than 1 200 ha and four packhouses, and B Corp certified. **No organic certification could be found.** Its production is conventional greenhouse.

### Delassus Group and Les Domaines Agricoles

Two of the country's biggest citrus, tomato, berry and avocado exporters. Corporate material references organic farming among other techniques, but **no organic certificate or dedicated organic export line was verifiable.** Their absence is a statement about the evidence, not about their scale.

### Argan private-label brands and traders

A large number of businesses rank highly in argan searches while claiming "Ecocert-certified" or "USDA-certified" status. Most are traders or private-label brands, several of them not Moroccan. They were excluded as a class: a brand that sells certified argan oil is not a Moroccan certified producer.

### FIMABIO and Biofach member lists

FIMABIO publishes no member directory. The Biofach Nuremberg exhibitor database was not retrievable. The more productive route for a future edition is the AMDIE-backed "Destination Morocco" organic pavilion at Natexpo in Paris, together with the Morocco Foodex exporter directory and a country-filtered query of the Ecocert register.

SECTION 06

# Morocco against Africa

## 6.1 The continent contracted in 2024

Africa’s organic sector had been the fastest-growing region in the world. In the 2023 data year its certified organic farmland rose 24.4 % to about 3.4 million hectares, against a global average of 2.6 %, on roughly 972 000 producers. Then it reversed.

For the 2024 data year, African organic farmland is reported at about 2.8 million hectares — a fall of roughly 17.6 %, and the first decline since 2011. FiBL attributes it to the EU compliance requirement described in Section 4.1. The corroborating detail is in cocoa: African organic cocoa exports fell 22.7 % to 22 467 t in 2024, and EU-compliant organic cocoa farmland in Africa fell from 309 164 ha to 238 258 ha, a decline of 22.9 %. Two independent measures of the same shock.

Note the divergence in that panel: area fell 17.6 % while exports rose 7.6 %. The continent lost certified hectares and shipped more. That is what a compliance transition looks like from the outside — marginal, weakly certified area falls out of the system while the operators who can meet the standard consolidate and grow. It is also the single best argument that African organic capacity was previously overstated by the equivalence regime.

FIGURE 6.1 · CERTIFIED ORGANIC AGRICULTURAL LAND, AFRICAN COUNTRIES WITH AN ATTRIBUTABLE FIGURE

Hectares. Data years differ by country and are shown in the label — these bars are not a like-for-like snapshot.

Sources: S1, S2, S3, S8, S9, S11, S13, S15, S16. Grades B–C.

DO NOT READ FIGURE 6.1 AS A LEAGUE TABLE

The bars mix data years from 2016 to 2024 because that is what is public. Uganda, Burkina Faso, Ethiopia and Togo are 2024 figures from the current FiBL edition; Morocco is 2023; Tanzania is 2019; Egypt is 2016. Tunisia’s figure has no stated year at all and competing values of 279 389, 290 000 and 306 500 ha circulate. Comparing a 2016 Egyptian figure with a 2024 Ugandan one is a category error, and the chart is shown with its data years attached for exactly that reason.

## 6.2 Country table – all 54 states

The table below covers every African state. 9 carry an attributable organic land figure; the remainder are recorded as *no data reported*, which reflects what is public rather than what exists on the ground. Several countries with no land figure nonetheless appear in the export and wild-collection columns.

| # | Country                  | Organic land (ha) | Yr   | Producers | Yr   | Wild coll. (ha) | Flagship organic products                                                  | Ev. |
|---|--------------------------|-------------------|------|-----------|------|-----------------|----------------------------------------------------------------------------|-----|
| 1 | Uganda                   | 505 308           | 2024 | 404 246   | 2023 | –               | Coffee, cocoa, cotton, sesame, vanilla, shea, spices                       | B   |
| 2 | Tunisia                  | 279 389           | –    | –         | –    | –               | Olive oil (93% of organic ha), dates                                       | C   |

**Wild collection** figures are FiBL's 2017 data year throughout and are nine years stale; Africa's total certified wild-collection area was reported at more than 14.3 million hectares in that year, dwarfing its certified cropland. **Ev.** is the evidence grade defined in Section 2.2.

### 6.3 Export performance into the EU

Volume rank into the EU tells a very different story from area rank. **Togo**, on soybeans, was the EU's seventh largest organic supplier of any origin in 2022 and eighth in 2023 — ahead of every other African country and most of Latin America. **Egypt** is described by the Commission as Africa's largest organic exporter to the EU overall. **Tunisia** converts a single crop, olive oil, into a world-leading position.

| Origin                    | Year        | Tonnes         | Rank     | Basis / category                                  | Ev.      |
|---------------------------|-------------|----------------|----------|---------------------------------------------------|----------|
| Togo                      | 2022        | 125 619        | 7        | all organic agri-food                             | B        |
| Tunisia                   | 2022        | 46 453         | 15       | all organic agri-food                             | B        |
| Egypt                     | 2022        | 41 296         | 17       | all organic agri-food                             | B        |
| Togo                      | 2023        | 104 068        | 8        | all organic agri-food                             | B        |

| <b>Africa total</b>       | <b>2024</b> | <b>687 395</b> | <b>–</b> | <b>all organic exports (+7.6% y/y)</b>            | <b>B</b> |
| <b>Africa cocoa total</b> | <b>2024</b> | <b>22 467</b>  | <b>–</b> | <b>organic cocoa (share of world 42080 t)</b>     | <b>B</b> |

Ranks are within different universes and are labelled accordingly: Togo, Tunisia and Egypt 2022 ranks are against all third countries; Morocco and Egypt 2024 ranks are within the fruit-and-vegetable preparations category; cocoa ranks are within Africa. Sources E21, E22, E24, E26, S1, S25.

Two observations follow. First, **African organic export success is single-commodity**: Togo is soy, Tunisia is olive oil, Sierra Leone is cocoa, Ethiopia is coffee. Morocco is the exception — its export mix spans oils, preserved vegetables, aromatics, saffron, dates and couscous. That diversity is a genuine structural advantage and it is why no single Moroccan figure appears near the top of any one list.

Second, **the categories African origins lead are low-unit-value**. Togo's 104 068 t of soybeans and Morocco's 7 307 t of prepared fruit and vegetables are not comparable economically, and a report that ranked them together on tonnage would mislead. Tonnage rank is a poor proxy for sector value, and it is the only rank the public data supports.

## 6.4 Regulatory maturity and the Tunisia asymmetry

Very few African countries have dedicated organic legislation in force. The ones that could be confirmed are **Tunisia** (Law 99-30 of 5 April 1999, with the implementing decree of 28 February 2001), **Morocco** (Law 39-12, 2013, effective 2018) and **Egypt** (Organic Agriculture Law, 2020, described as not fully implemented). Across East Africa the operative instrument is a regional standard rather than national law: **EAS 456:2007**, the East African Organic Products Standard, adopted by the East African Community in April 2007 for Burundi, Kenya, Rwanda, Tanzania and Uganda, marketed under the *Kilimohai* mark and currently under revision as FDEAS 456:2024. It was the world's second regional organic standard after the EU's. **There is no pan-African organic standard.**

On EU recognition the asymmetry is stark and it runs against Morocco. Tunisia's 1999 law is the legal basis for its inclusion in Annex I of Regulation (EU) 2021/2325 — recognition in part, for categories A and F grown in Tunisia and category D processed there from Tunisian organic ingredients. It is the only African country on that list. Morocco's Law 39-12, drafted explicitly to harmonise with the EU framework, has produced no such recognition.

The window is closing on the asymmetry either way. Annex I recognition expires on 31 December 2026 unless the Commission's December 2025 proposal to extend it to 2036 is adopted. If it is not, Tunisia and Morocco arrive at the same compliance regime on 1 January 2027 and a twenty-seven-year Tunisian advantage simply lapses. If it is, that advantage runs another decade. Moroccan trade diplomacy has one obvious objective here, and it is Article 47 of Regulation (EU) 2018/848 — the bilateral organic trade agreement route that has been used with Chile, Switzerland and the United Kingdom. No EU–Morocco organic trade agreement could be found.

One further gap is worth naming. The African Union's **Ecological Organic Agriculture Initiative** — the continental policy vehicle for organic mainstreaming, whose strategic plan for 2015–2025 was reviewed in July 2025 — operates in eight countries: Ethiopia, Kenya, Uganda, Tanzania, Mali, Nigeria, Benin and Senegal. **Morocco is not one of them.** For a country with a decade-old organic law and a national inter-profession, that absence from the continent's principal organic policy platform is conspicuous.

## 6.5 Where Morocco actually ranks

Pulling the comparison together, Morocco's position depends entirely on the measure chosen — and the measures point in opposite directions.

**TABLE 6.2 · MOROCCO'S AFRICAN POSITION BY MEASURE**

| Measure                                      | Morocco                                              | African leader                | Assessment                                                                   |
|----------------------------------------------|------------------------------------------------------|-------------------------------|------------------------------------------------------------------------------|
| Certified organic cropland                   | 13 325 ha (2023)                                     | Uganda, 505 308 ha (2024)     | Marginal — about 0.4 % of the continental total                              |
| Certified wild-collection area               | 273 000 ha (2017/18)                                 | Zambia, 5.9 m ha (2017)       | Mid-tier; the argan forest is a genuine asset                                |
| Number of organic producers                  | >650 operators (2021)                                | Uganda, 404 246 (2023)        | Two orders of magnitude smaller; a commercial rather than smallholder sector |
| EU import rank, all organic                  | not published                                        | Togo, 8th worldwide (2023)    | Unknown; almost certainly outside the top ten                                |
| <b>EU rank, organic F&amp;V preparations</b> | <b>4th worldwide (2024)</b>                          | <b>Morocco leads Africa</b>   | <b>Continental leader in its category</b>                                    |
| Export mix diversity                         | Oils, preserves, aromatics, saffron, dates, couscous | Single-commodity elsewhere    | Structurally the most diversified organic exporter in Africa                 |
| Dedicated organic law in force               | Yes — Law 39-12, effective 2018                      | Tunisia, 1999                 | Among only three confirmed in Africa                                         |
| EU equivalence recognition                   | None, and never held                                 | Tunisia — sole African holder | Structural disadvantage, expiring end-2026                                   |
| AU EOA Initiative participation              | Not a member                                         | Eight countries participate   | Absent from continental organic policy                                       |

Data years differ by row and are shown. Sources as per Sections 3, 4 and 6.

The pattern is consistent. Measured as an agricultural land-use statistic, Moroccan organic farming is a rounding error on the African total and will remain so through 2030 on any realistic trajectory. Measured as a commercial export sector — diversity of portfolio, degree of processing, position in the categories it actually competes in, and regulatory readiness for the post-2025 EU regime — it is at or near the front of the continent. Choosing which of those two framings to use is the most important analytical decision anyone makes about this sector, and most published commentary chooses the first without noticing it has chosen.

SECTION 07

# The demand Morocco sells into

## 7.1 A market growing faster than European supply

Global organic retail sales reached a record **€145.0 billion** in 2024 on **98.9 million hectares** of organic farmland — 2.1 % of world farmland — worked by about **4.8 million producers**. Land has now been effectively flat near 99 million hectares for three years while value has kept rising. Demand is outgrowing the certified production base, which is the structural condition that favours third-country suppliers.

| Market        | Retail value (bn EUR) | Year | Growth | Note                                    |
|---------------|-----------------------|------|--------|-----------------------------------------|
| World         | 145.0                 | 2024 | +5.0 % | Record high                             |
| United States | 60.4                  | 2024 | –      | Largest single market                   |
| Europe        | 58.7                  | 2024 | +4.1 % |                                         |

Sources D1, D6, D12, D14, D16. All grade B.

Within Europe the same gap is visible directly. EU organic retail grew 3.6 % in 2024 to €49.5 billion, and the two largest markets accelerated in 2025 — Germany +6.7 % to €18.23 billion, Italy +6.2 % to €6.9 billion, France +3.6 % to €12.6 billion with organic fruit and vegetables up 7.3 %. Meanwhile EU organic *area* is barely moving: German organic farmland grew 1.1 % in 2025 and the number of French organic farms actually **fell 1.3 %**. German industry reporting for 2026 was headlined, bluntly, with the observation that retail must increasingly import organic.

The EU’s own policy target confirms the gap rather than closing it. The Farm to Fork objective of **25 % of EU farmland organic by 2030** stands against a current **11.1 %** on the FiBL basis, or 10.7 % on Eurostat’s. Independent projection puts the realistic 2030 outcome at **15–18 %**, with 25 % attainable closer to 2035 absent much stronger policy. Europe will not supply its own organic demand this decade.

### WHAT THIS MEANS FOR A MOROCCAN EXPORTER

European organic demand is growing at roughly three to six per cent a year; European organic supply is growing at about one. The deficit is met by imports, and the fastest growth in 2025 was in specialised organic stores in France (+8.5 %) and in supermarkets rather than discounters in Germany (+8.6 % against +6.7 %) — the premium channels, not the price-led ones. German 2025 growth came from volume rather than price increases, which means the opportunity is in *more product at stable premiums* rather than in rising premiums. Morocco’s proximity, counter-seasonality and processing capacity match that demand shape well.

## 7.2 Competitive position by product line

The organic-specific competitive data is thin — for most categories only whole-sector figures exist — and the assessments below are graded accordingly. Where a figure covers conventional and organic together, that is stated.

TABLE 7.1 · MOROCCO'S POSITION BY EXPORT LINE

| Line                        | Benchmark origins and evidence                                                                                                                                                                                                                                                                                                                     | Morocco's position                                                                                                                                                                        |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Argan oil                   | Morocco holds more than 80 % of global supply. Market-size estimates from commercial vendors diverge fourfold; three of five cluster at <b>USD 0.43–0.45 bn</b> for 2025 with a consensus CAGR of <b>8.6–12.6 %</b> . Roughly 55 % of demand is cosmetic. All vendor sources, grade C.                                                             | <b>Near-monopoly.</b> The only line where Morocco sets the market rather than entering it. Also the most cooperative-intensive and the most rain-fed.                                     |
| Prepared fruit & vegetables | Category total into the EU 130 708 t in 2024, +7.6 %. India 11 398 t, Mexico 7 919 t, Brazil 7 357 t. Grade B.                                                                                                                                                                                                                                     | <b>4th worldwide, 1st in Africa</b> at 7 307 t and +216.3 %. The strongest verified competitive position Morocco holds in any organic category.                                           |
| Citrus                      | Spain is the incumbent — third largest organic citrus producer worldwide, organic at 6.5 % of its citrus area — but faces a <b>5.44 m t 2025/26 crop, down 10.7 % and a 16-year low</b> . Egypt, Türkiye and South Africa organic volumes: not found.                                                                                              | <b>Open window.</b> The clearest near-term opening in the report, though no Moroccan organic citrus tonnage could be established to size it.                                              |
| Olive oil                   | <b>Tunisia is the world's largest organic olive oil exporter</b> — 50 900 t worth about TND 714 m to end-September 2025. World olive oil output rose 38 % to 3.57 m t in 2024/25, Spain 1.42 m t. Grade B.                                                                                                                                         | <b>Structurally behind.</b> A neighbour with EU equivalence, far larger organic olive area and first-mover position. Morocco's route is PDO and premium positioning, not volume.          |
| Berries                     | Morocco exported 64 400 t of raspberries in 2024/25 (+13.8 %) and about 67 300 t of blueberries in 2023/24 — <b>whole-crop, not organic</b> . Spain's berry exports are worth €2.11 bn. <b>Ukraine supplies roughly 20 % of EU organic raspberry and 30 % of organic blackberry imports</b> on 15 400 t — a low-cost origin with duty-free access. | <b>Large but unmeasured.</b> Morocco is a berry power in general and an unknown quantity in organic berries specifically. Ukraine is the direct competitive threat.                       |
| Dates                       | Tunisia's organic date exports were 6 700 t to end-June 2025 — <b>volume down 8.1 %, value down 26.4 %</b> , an implied unit-price fall of roughly 20 %, against a record 404 000 t Tunisian crop. Germany is the leading destination.                                                                                                             | <b>Deflating category.</b> Morocco's Drâa-Tafilalet Majhoul is a premium product, but entering organic dates against a Tunisian supply glut is poorly timed.                              |
| Aromatic & medicinal plants | No EU demand-side figures could be obtained for this category from any origin. Morocco's national AMP output is about 33 000 t a year, rosemary 63 % and thyme 24 % of exported volume — whole-sector, grade C.                                                                                                                                    | <b>Unquantified.</b> AMP is the largest single share of Moroccan organic cropland at about 21 %, and the category on which the report has the least demand-side evidence. A priority gap. |

## SECTION 08

# Assessment, risks and what follows

## 8.1 Strengths, weaknesses, opportunities, threats

### STRENGTHS

- Fourth largest third-country supplier of organic prepared fruit and vegetables to the EU in 2024, on volume that tripled in a year.
- The most diversified organic export portfolio in Africa — oils, preserves, aromatics, saffron, dates, couscous — against single-commodity peers.
- Near-monopoly in argan, a rain-fed, drought-robust, high-margin line with an established women's-cooperative supply base and strong fair-trade credentials.
- Exporters were already certified directly against EU rules, so the 2025 compliance transition was an adjustment rather than a rupture.
- Proximity and counter-seasonality to the EU, with direct reefer services from Agadir and a functioning statutory export control authority.
- A dedicated organic law in force since 2018 — one of only three confirmed in Africa — plus a real certification subsidy instrument.

### WEAKNESSES

- 13 325 ha of certified cropland: about 0.4 % of Africa's organic land, and 28 % below the 2022 peak.
- No reliable public statistics after 2022, no per-crop organic tonnage at all, and an area series that contradicts itself.
- Effectively no domestic organic market — the only estimate available is eight years old — so there is no fallback outlet for certified product.
- Certification subsidy caps bind far below actual cost: a 4 ha unit can face roughly 43 000 MAD against a 10 000 MAD ceiling.
- Three interprofessional bodies in twelve years; the 2020 loss of FIMABIO's status cost the sector continuity.
- No EU equivalence recognition and no Article 47 organic trade agreement.

### OPPORTUNITIES

- EU organic demand is growing three to six per cent a year against roughly one per cent supply growth; the 25 %-by-2030 target will be missed, so import dependence is structural.
- Spain's 2025/26 citrus crop is a 16-year low — the clearest near-term opening in this report.
- Tunisia's equivalence recognition expires at the end of 2026 unless extended; if it lapses, a twenty-seven-year Maghreb asymmetry closes.
- Growth in 2025 came from premium channels — French specialist stores +8.5 %, German supermarkets ahead of discounters — which suits Moroccan quality positioning.
- An Article 47 bilateral organic agreement is an available and so far unused instrument.
- Africa's compliance-driven contraction removes weakly certified competing supply.

### THREATS

- Water. Irrigation allocation for 2024–25 was about 17 % of planning volume, and the organic export crops sit in the most water-intensive systems.
- If the Commission's proposal passes, Tunisia's equivalence runs to 2036 and the asymmetry hardens for another decade.
- Ukraine is taking 20–30 % of EU organic berry imports as a low-cost, duty-free origin.
- Organic dates are in unit-price deflation on a record Tunisian crop.
- The Western Sahara judgments impose origin-declaration and traceability burdens on Dakhla-region produce, with the duration of the annulments' maintained effects still unestablished.
- German 2025 growth came from volume, not price — premiums are not widening, so margin has to come from cost and scale.

## 8.2 The 2030 target arithmetic

The 2023–2030 contrat-programme targets **100 000 ha** of certified organic land by 2030 against a stated baseline of **14 000 ha** in 2019. It is worth stating what that requires, because the previous programme's failure is instructive rather than embarrassing.

Taking the most recent comparable figure — 13 325 ha for the 2023 data year — reaching 100 000 ha by 2030 means adding roughly **86 700 hectares in seven years**, about **12 400 ha a year**, which is close to a **doubling of the entire current certified base every single year** for the first two years and a sustained compound rate near 33 % a year thereafter. The 2011–2020 programme, working from a smaller base toward a

target 2.5 times less ambitious, achieved roughly 14 000 ha of net addition over a decade — about 1 400 ha a year.

#### THE HONEST CONCLUSION ON THE AREA TARGET

On the historical rate of addition, Morocco reaches approximately **23 000 ha** by 2030, not 100 000 ha. Hitting the target would require a rate of conversion roughly nine times anything the sector has demonstrated, in a decade of water scarcity, with a certification subsidy whose caps bind at a fraction of real cost. This is an author calculation from the figures in Sections 3.1 and 3.5, and it should be read as an order-of-magnitude test rather than a forecast — but no plausible reading of the published series makes the target reachable.

That is an argument for changing the target, not for despairing of the sector. An area target is the wrong instrument for a sector whose comparative advantage is demonstrably in value density and processing rather than in hectares. A programme measured on **certified export value**, on **the processed share of organic exports**, or on **the number of operators holding Article 46-compliant certification** would track what Morocco is actually good at, and would not be quietly failed by a drought.

### 8.3 Recommendations

Addressed to the parties who can act on them, and limited to what the evidence in this report supports.

#### For the ministry and Maroc Bio — publish a reconcilable series

The single cheapest improvement available to this sector is an annual statistical release that separates cultivated area, in-conversion area and wild-collection area, states its basis, and gives operator counts and per-crop certified tonnage. The absence of this is why a report like this one has to spend a section explaining why the numbers disagree, and why the sector cannot demonstrate its own success to buyers or to the Commission.

#### For trade policy — pursue Article 47, and prepare for both Tunisia outcomes

A bilateral EU–Morocco organic trade agreement under Article 47 of Regulation (EU) 2018/848 is the instrument that would put Morocco on the footing Chile, Switzerland and the UK occupy. It should be on the table before the Annex I extension question is settled, not after. Contingency planning should assume Tunisia’s recognition runs to 2036.

#### For the subsidy instrument — raise the caps, or index them to hectares

A 90 % rate against a 10 000 MAD ceiling delivers a fraction of that in practice for units at the top of the band. Indexing the ceiling to certified area, or raising it to approximate real certification cost at the band boundary, would change smallholder conversion economics more than any further area target.

#### For exporters — verify your certifier’s Article 46 listing, and route through Agadir

Since 1 January 2025 the operative question is not whether your certificate is valid but whether your certifying body appears in Annex II of Regulation (EU) 2021/1378 as consolidated. Check it against the current consolidated text, not a cached list. On logistics, Souss-Massa cargo routed through Tanger Med rather than Agadir carries more than 700 km of avoidable reefer trucking.

#### For sector development — target the processed categories, not the area statistic

The one place Morocco demonstrably leads is prepared fruit and vegetables, where it is fourth worldwide and first in Africa. Aromatic and medicinal plants are the largest share of organic cropland and the category with the least demand-side evidence in this report; sizing that market is a prerequisite for investing in it.

**For anyone using this report commercially**

Verify current certificates directly with the certifying body before contracting. This directory is a research finding and a snapshot, not a due-diligence report, and Section 2.1 sets out the limits of the evidence it rests on.

## ANNEX A

# Source register

138 sources, keyed to the references used throughout. **Tier** records the nature of the source, not this report's confidence in any particular figure drawn from it: *Primary* means an institutional, regulatory, statistical or company-own source; *Secondary* a trade-press or academic rendering; *Weak* a commercial blog or market-research vendor page, used only where nothing better existed and always flagged in the text. As Section 2.1 records, none of these documents could be opened directly during compilation.

| Ref | Title                                                                                                                                                                                                                                                                                                                                          | Publisher                                  | Year | Tier      |

ANNEX B

# The open dataset

Every figure and table in this report is generated from CSV files published alongside it. Nothing is hard-coded into the document. To correct a number, edit the CSV and rebuild; the report will follow.

TABLE B.1 · FILES IN DATA/

| File                              | Contents                                                                                                  |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------|
| africa_organic_land.csv           | All 54 African states: organic land, share, producers, wild collection, flagship products, evidence grade |
| morocco_area_series.csv           | The Moroccan area series with its competing bases and data years                                          |
| morocco_key_indicators.csv        | Operators, output, exports, domestic market, crop shares                                                  |
| morocco_targets.csv               | Both contrats-programmes and Génération Green, with outcomes                                              |
| morocco_organic_operators.csv     | The producer and exporter directory with verification status                                              |
| eu_organic_imports.csv            | EU organic import totals 2021–2025                                                                        |
| eu_top_suppliers_2024.csv         | Leading third-country origins with recomputed shares                                                      |
| eu_fruitveg_preparations_2024.csv | The category in which Morocco ranks fourth                                                                |
| africa_eu_organic_exports.csv     | African origins' organic exports into the EU                                                              |
| eu_organic_retail.csv             | Retail market values, world and European                                                                  |
| world_context.csv                 | Global and continental aggregates                                                                         |
| eu_regulatory_timeline.csv        | The equivalence-to-compliance transition, dated                                                           |
| cjeu_western_sahara.csv           | The 4 October 2024 judgments                                                                              |
| sources.csv                       | The source register reproduced in Annex A                                                                 |

## B.1 Rebuilding this document

The report is rendered from HTML and CSS through WeasyPrint. Charts are generated as inline SVG and HTML by report/src/charts.py, so the PDF is fully vector and the figures inherit the document’s typography.

```
pip install weasyprint pyphen
cd report/src
python3 build.py          # -> report/Morocco-Organic-Market-Report-2026.pdf
```

## B.2 Licence and citation

The datasets and the build code are released for reuse; the underlying figures belong to the organisations credited in Annex A and their own terms govern. This document should be cited with its edition date and, wherever a figure is quoted from it, with that figure’s own data year and source reference — which is the entire point of Section 2.

CORRECTIONS

Corrections are welcome and are best submitted as a change to the relevant CSV row together with the source that supports it. The ten open questions in Table 2.2 are the most valuable places to start; closing any of them would materially improve the next edition.
